5057: 9/24 Class 5

1) Paths: ordered set of nodes and the edges that connect them
   - $P_{x,y}$, of length n — $G = (V, E)$
   - Shortest path - geodesic
   - Eccentricity - longest shortest path from i to any other node j
   - Radius - minimum eccentricity of V — select optimally positioned node
   - Diameter - maximum eccentricity of V — select least optically placed nodes
   - If G lacks a cycle, it is acyclic
